

1. Data Title :

Bank Marketing Campaign Dataset

2. Dataset Source :

Source: Kaggle (Original data from the UCI Machine Learning Repository)

Dataset: [Bank Marketing Dataset](#)

Author: Moro, S., Rita, P., & Cortez, P

3. Business Domain:

Banking, Financial Marketing & Customer Analytics

4. Dataset Size :

Row : 11,162

Column : 17

5. Variable Description :

N	Variable	Description
1	Age	Customer's age
2	Job	Customer's occupation
3	Marital	Marital status
4	Education	Education level
5	Default	Has credit in default (Yes/No)
6	Balance	Average yearly account balance (EUR)
7	Housing	Indicates whether the customer has a housing loan (Yes/No)
8	Loan	Indicates whether the customer has a personal loan (Yes/No).
9	Contact	Communication method used to contact the customer (cellular, telephone, unknown)
10	Day	Day of the month when the customer was last contacted
11	Month	Month in which the last marketing contact occurred
12	Duration	Duration of the last contact with the customer (in seconds)
13	Campaign	Number of contacts performed during the current marketing campaign
14	Pdays	Number of days since the customer was last contacted in a previous campaign (-1 indicates the customer had not been contacted previously)
15	Previous	Number of contacts before this campaign
16	Poutcome	Outcome of the previous marketing campaign
17	deposit	Target variable indicating whether the customer subscribed to a term deposit (Yes/No)

6. Why I Selected This Dataset? :

I selected this dataset because it represents a real-world direct marketing campaign conducted by a banking institution. It contains customer demographic information, financial characteristics, and marketing campaign data, making it ideal for data cleaning, exploratory data analysis (EDA), predictive modeling, and business intelligence dashboard development. The dataset also provides valuable business insights that can help improve marketing strategies and increase campaign effectiveness. The main objective of this project is to evaluate Uber's business performance by analyzing key performance indicators such as total booking value, completed rides, cancelled rides, and customer ratings. The project focuses on identifying the main reasons for ride cancellations, measuring their impact on revenue, and uncovering operational issues that affect the overall service. The insights can help support better business decisions and improve customer satisfaction.

7. Why This Dataset Satisfies the Project Requirements?:

Banks invest significant resources in telemarketing campaigns to promote term deposit subscriptions.

Contacting every customer is both expensive and time-consuming. Therefore, the bank needs to identify customers who are more likely to subscribe to a term deposit.

The objective of this project is to analyze customer characteristics and campaign performance, identify the factors influencing subscription decisions, and build a machine learning model capable of predicting whether a customer is likely to subscribe. The findings will help optimize future marketing campaigns, improve conversion rates, and reduce unnecessary marketing costs.

8. Why This Dataset Satisfies the Project Requirements?:

This dataset satisfies the project requirements because it contains over **11,000 customer records** with both numerical and categorical variables. It supports comprehensive data cleaning, exploratory data analysis, feature engineering, binary classification using machine learning, and interactive Power BI dashboard development. Additionally, it enables the extraction of meaningful business insights and actionable recommendations that can support data-driven decision-making in banking marketing campaigns.
